Standards-Based Operation of a Nuclear Physics User Facility

Summary — As the nation's largest university-based nuclear science user facility, the National Superconducting Cyclotron Laboratory (NSCL) at Michigan State University plays a leading role in rare isotope research and nuclear science education. NSCL produces word-class beams of rare isotopes using the in-flight separation technique and serves a user community of more than 700 scientists. NSCL established management systems for quality, environmental impacts,

and occupational health and safety. These systems have been certified according to the international standards ISO 9001, ISO 14001, and ISO 18001 and cover all processes in support of delivery of beams to experimenters. Applying the experience of established industry standards in management of a nuclear physics research facility resulted in efficient, reliable, and safe facility operation and highly satisfied facility users.

Standards-Based Integrated Management at NSCL

All processes that affect safety, environmental impact, and delivery of beams to experimenters are well defined and communicated to employees and to users of the facility.

Changes to processes or equipment, including experimental setups, require reviews that consider safety, environmental impact, and quality impact.

External audit provides annual review of business processes.

Service Level Descriptions define support levels that facility users can expect.

For every experiment, an Experiment Service Description will be compiled with details of provided services.

ISO 9001 – Quality Management System
Covers the delivery of rare isotope beams to users and all related processes.

ISO 14001 – Environmental Management System

Establishes significant aspects regarding environmental impact, leading to the development of appropriate mitigation plans.

ISO 18001 – Occupational Health and Safety Management System

Controls health and safety risks, establishes training requirements, and provides framework for performance enhancement.

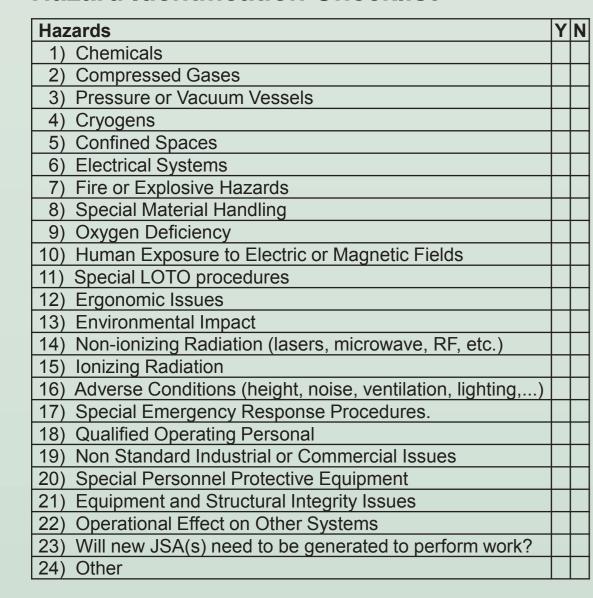

Environmental, Safety, and Health (ESH) Management System

NSCL's Environmental, Safety and Health Management System assists management in ensuring that a safe and healthy workplace is provided to all employees and facility users while also protecting the environment.

Assessment of risks to ES&H for all work allows to identify appropriate preventative and protective measures in order to comply

with any relevant statutory provisions, and to maintain health and safety of all persons. Determination of a list of significant aspects (significant environmental, safety or health impact of operations conducted at NSCL) allows the development of mitigation plans. Formalized safety policies and procedures are readily available to all employee.

Hazard Identification Checklist

Elements of the ESH Management System

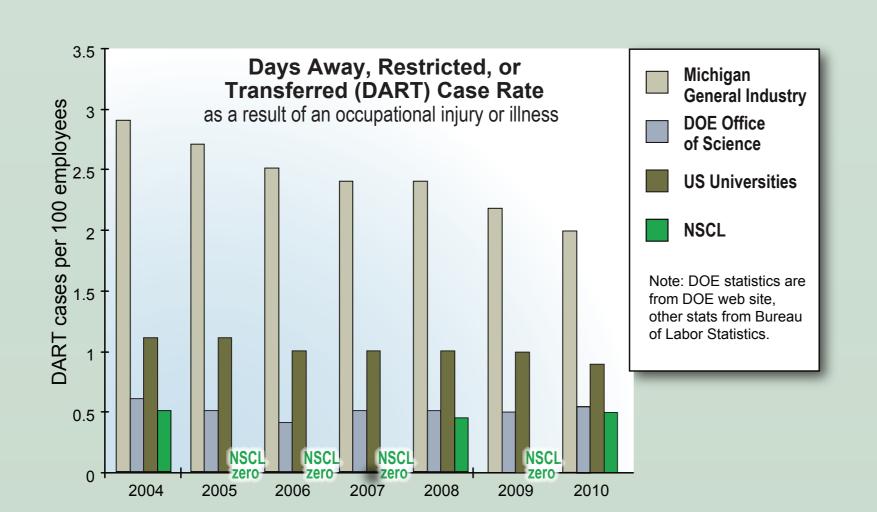

- Job Safety Analysis to provide a process for task hazard identification & documentation of control
- Tier I Inspections including reporting and tracking of findings
- Record of Decision to formally document safety related decisions
- Causal Analysis of all accidents to prevent recurrence
- Stop Work Authority empowers all NSCL workers to stop imminent hazards
- Operational Readiness Review to determine operational compliance & safety preparedness
- Safety Suggestion Program to promote employee involvement & ownership of safety

Safety Training

- NSCL training database
 to record required and completed training,
- integrated to NSCL access control database

Communication of training requirements

Provide all training courses online for immediate access

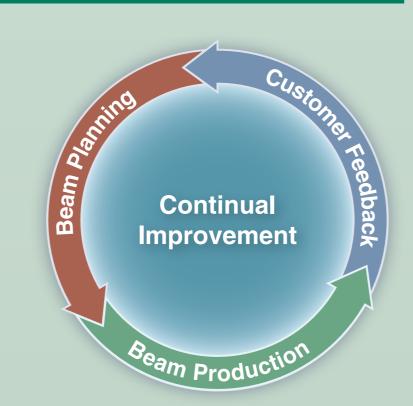

Continuous Improvement is a requirement of all three standards

NSCL has a Continuous Improvement Committee

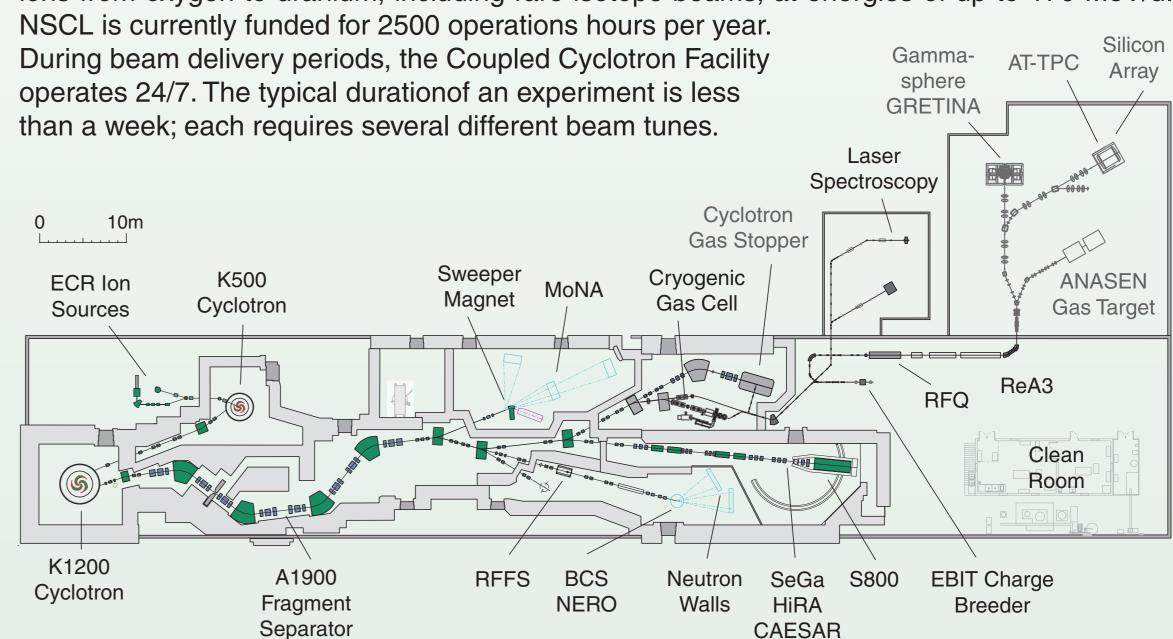

- Review of all Trouble Reports (bi-weekly)
- Committee is stakeholder in all decisions affecting reliability

Input received from:

- Trouble Report System
- User Surveys
- Verbal communications through line management
- Annual internal and external audits

The National Superconducting Cyclotron Laboratory provides accelerated beams of heavy ions from oxygen to uranium, including rare isotope beams, at energies of up to 170 MeV/u.

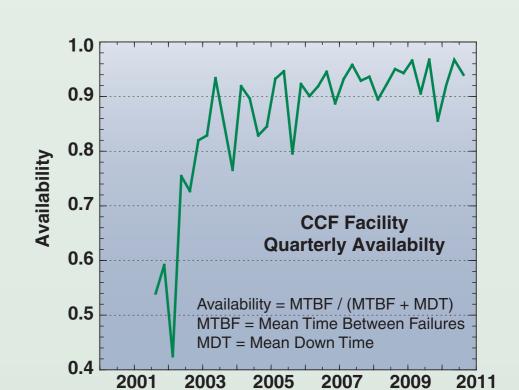

Quality Management System (QMS) covers the delivery of beams

The objectives of the QMS are measurable performance indicators relevant for facility operation:

- Rare Isotope Beams will be delivered with 90% availability
- Rare Isotope Beams will be delivered within 24 hours of the scheduled time

High availability results in dependable schedule which leads to high user satisfaction

Every system or process failure triggers a "Trouble Report"

- Root cause analysis, corrective and preventive action
- Risk-based graded response to address failures (for all 3 systems)

Labwide Preventive Maintenance Database

- Scheduled maintenance with reminder emails
- Maintenance records to document maintenance history

Experimenter Feedback Survey to analyze "Customer Satisfaction"

One common risk management matrix for all management systems

Corrective and preventive action process for all three management systems

- Suggestions for improvements, safety and environmental nearmisses, safety/environmental findings, and audit findings
- Risk Management Matrix determines risk based on Severity (impact on facility downtime, equipment loss, environmental, safety/health, project management) and probability of occurrence
- Graded response based on risk

Graded response based on risk

Analysis of User Feedback Data (2009-04-01 – 2012-04-01)

Crisis	Project stopped. Catastrophic threat to mission need.	Death, permanent total disability	Irreversible severe environmental damage that violates law or regulation	Loss exceeding \$1M	Downtime exceeding 285 hours
Critical	Goals and objectives are not achievable. Additional funding or time may be required	Permanent partial disability, injuries or occupational illness that may result in hospitalization of at least three personnel	Recoverable serious environmental damage causing a violation of law or regulation	Loss exceeding \$210K but less than \$1M	Downtime exceeding 60 hours but less than 285 hours
Significant	Significant degradation objectives, significantly increased cost or significant impact on schedule.	Injury or occupational illness resulting in more than one lost work day	Correctable moderate environmental damage, possibly causing a violation of law or regulation	Loss exceeding \$42K but less than \$210K	Downtime exceeding 12 hours but less than 60 hours
Marginal	Minor degradation of objectives. Marginal increase of cost, marginal impact on schedule.	Injury or occupational illness resulting in one lost work days	Mitigatible environmental damage without violation of law or regulation	loss exceeding \$3.5k but less than \$42k	Downtime exceeding 1 hour but less than 12 hours
Negligible	Minimal or no consequence on performance. No impact on project cost or schedule.	Injury or illness not resulting in a lost work day	Minimal environmental damage not violating law or regulation	loss less than \$3.5k	Less than 1 hour downtime
	Critical Significant Marginal	Crisis Goals and objectives are not achievable. Additional funding or time may be required Significant Significant degradation objectives, significantly increased cost or significant impact on schedule. Minor degradation of objectives. Marginal increase of cost, marginal impact on schedule. Minimal or no consequence on performance. No impact on project cost or	Crisis Goals and objectives are not achievable.
